

Documentation "Tools".

The "TOOLS" directory contains some tools that may be useful.

- **RECUP SIGNATURES.**

This set of procedures (bash + awk) is used to create the SQL commands needed to feed the "signature" table from the description files contained in the "rules" directory.

Generated SQL statements are "replace" orders that induce new ranks or replace existing ones.

- **CRE_TRIGGER_INS_ALERT.**

This SQL procedure creates a trigger on the main database so that any alert matches a signature. If the signature does not exist, it is created by this trigger.

- **CTRL_CATEGORY_SIGNATURE_MAPPING.**

This SQL procedure, to run on the "running" database, indicates all the mapping anomalies.
